

control of fuel cell pdf

Two fuel cell related control problems are investigated in this study, namely, the control of the cathode oxygen supply for a high-pressure direct hydrogen Fuel Cell System (FCS) and control of the anode hydrogen supply from a natural gas Fuel Processor System (FPS).

MODELING AND CONTROL OF FUEL CELL SYSTEMS AND FUEL PROCESSORS

Patent number: WO 00116426 Control of a fuel cell Applicant: Honda, Japan This invention provides a method of controlling a fuel cell which stabilises the output voltage of each cell, increases their service life, and which is simple in structure and inexpensive to manufacture.

(PDF) Control of PEM Fuel Cell Distributed Generation Systems

A fuel cell is like a battery in that it generates electricity from an electrochemical reaction. Both batteries and fuel cells convert chemical energy into electrical energy and also, as a by-product of this process, into heat.

Fuel cell basics

Two control problems of the fuel cell power generation system are formulated. The first problem is the control of the air supply system for a high-pressure direct hydrogen fuel cell system (FCS). The objective is to control the compressor motor command to quickly and efficiently replenish the cathode oxygen depleted during system power generations.

Control of Fuel Cell Power Systems - University of Michigan

€ Fuel cells require relatively pure fuel, free of specific contaminants. These contaminants include sulfur and carbon compounds, and residual liquid fuels (depending on the type of fuel cell) that can deactivate the fuel cell catalyst. description of a fuel cell system and after that, thoughts about additional power production is presented. Then a description on hybrid systems for the ship and the specification of requirements for the fuel cell system is given. Finally the thesis is ended with a discussion and conclusion chapter.

Design of a fuel cell system

First Fuel Cell
In 1839, William Grove, a British jurist and amateur physicist, first discovered the principle of the fuel cell. Grove utilized four cells, each containing hydrogen and oxygen, to produce electric power which was then used to split the water in the smaller upper cell into hydrogen and oxygen

Introduction to Fuel Cells - Theory Department

bonates fuel cell (MCFC) technology, such as the internal reforming of natural gas to hydrogen. The use of an established natural gas infrastructure was a key advantage in developing fuel cells for large stationary prime power applications. Substantial technical and commercial development continued in the 1980s, notably in the area of PAFC.

A fuel cell is a device that uses hydrogen (or hydrogen-rich fuel) and oxygen to create electricity by an electrochemical process. A single fuel cell consists of an electrolyte sandwiched between two thin electrodes (a porous anode and cathode) Hydrogen, or a hydrogen-rich fuel, is fed to the anode where
